In this paper, we investigate existence of *n*-tuplet coincidence point theorems in partially ordered probabilistic metric spaces. Also, we gave uniqueness of *n*-tuplet fixed point theorems in this space.

1. Introduction

Probabilistic metric spaces were introduced by Menger in his fundamental paper [1] in 1942. In Menger's theory, the notion of distance between two points x and y is replaced by a distribution function $F_{x,y}$. The value of $F_{x,y}$ at any point t is represented by $F_{x,y}(t)$. $F_{x,y}(t)$ is interpreted as probability that the distance between x and y is less than t. Sehgal first introduced the notion of contraction mapping on a probabilistic metric space in [2, 3]. In fact the study of such spaces received an impetus with the pioneering works of Schewizer and Sklar [4]. Then several authors have studied probabilistic spaces; see [5–9].

Guo and Lakshmikantham initiated the concept of coupled fixed point [10] in 1987. After that, Bhaskar and Lakshmikantham introduced the notion of mixed monotone property and gave some coupled fixed point theorems in ordered metric spaces in 2006 [11]. In 2012, the extention of coupled fixed point theorems to tripled fixed point theorems for nonlinear mapping in partially ordered metric space was introduced by Berinde and Borcut [12]. Then, some coupled and tripled fixed point results were obtained by many authors [13–19]. In 2013, Ertürk and Karakaya gave the concept of *n*-tuplet fixed point theorems in partially ordered metric spaces [20]. Alam, Imdad, and Ali unified *n*-tuplet fixed point results in ordered metric space in 2016 [21]. Their survey article is recommended to someone who wants to have details about this theory.

Hu and Ma studied couple coincidence point theorems in partially ordered probabilistic metric spaces in [22]. Recently, Binayak S. et al. [23] gave tripled coincidence point results in partially ordered probabilistic metric spaces.

Inspired by the above studies, we introduce *n*-tuplet fixed point theorems in partially ordered probabilistic metric spaces. This paper is organized as follows. Section 2 is devoted to giving some preliminaries. In Section 3, we obtain existence of *n*-tuplet fixed point theorems. Finally, Section 4 concerns the uniqueness of fixed point. These are the extensions of coupled and tripled fixed points in partially ordered probabilistic metric spaces.

2. Preliminaries

Definition 1 (see [4]). A triangular norm (shorter Δ – norm/t – norm) is a binary operation Δ on the interval [0, 1],

$$\Delta: [0,1] \times [0,1] \longrightarrow [0,1] \tag{1}$$

that satisfies the following conditions:

- (a) $\Delta(a, 1) = a, \Delta(0, 0) = 0,$
- (b) $\Delta(a,b) = \Delta(b,a)$,
- (c) $\Delta(c,d) \ge \Delta(a,b)$ for $c \ge a, d \ge b$,
- (d) For all $a, b, c \in [0, 1]$, $\Delta(\Delta(a, b), c) = \Delta(a, \Delta(b, c))$.

Principal examples of Δ – norms are

²Department of Mathematical Engineering, Faculty of Chemistry-Metallurgical, Yıldız Technical University, 34210 Istanbul, Turkey

- (i) $\Delta_M(a,b) = \min(a,b)$,
- (ii) $\Delta_{P}(a,b) = a.b$,
- (iii) $\Delta_{I}(a, b) = \max(a + b 1, 0),$
- (iv) $\Delta_D(a,b) = \begin{cases} \min(a,b), & \text{if } \max(a,b) = 1\\ 0, & \text{otherwise.} \end{cases}$

Above Δ – norms have the following relations:

$$\Delta_D < \Delta_L < \Delta_P < \Delta_M. \tag{2}$$

Definition 2 (see [4]). A function $F: \mathbb{R} \longrightarrow \mathbb{R}^+$ is called a distribution function if it is nondecreasing, left continuous with

$$\inf \left\{ F\left(t\right) : t \in \mathbb{R} \right\} = 0$$
 and
$$\sup \left\{ F\left(t\right) : t \in \mathbb{R} \right\} = 1.$$
 (3)

In addition, if F(0) = 0, then F is called a distance distribution function. We denote the set of all distance distribution functions by L^+ and H is a specific distance distribution function (also known as Heaviside function) defined by

$$H(t) = \begin{cases} 0, & t \le 0 \\ 1, & t > 0. \end{cases}$$
 (4)

Definition 3 (see [1]). Let X be a nonempty set, F be a mapping defined on $X \times X$ into L^+ , and Δ be a t – norm. If the following conditions are satisfied, (X, F, Δ) is called Menger probabilistic metric spaces:

- (1) $F_{x,y}(t) = H(t)$ for all t > 0 if and only if x = y;
- (2) $F_{x,y}(t) = F_{y,x}(t)$, for all t > 0 and $x, y \in X$;
- (3) $F_{x,y}(t+s) \ge \Delta(F_{x,z}(t), F_{z,y}(s)), \forall t, s \ge 0, x, y, z \in X.$

Example 4. Let Δ be an arbitrary t – norm, X = [-1, 1], and

$$F_{x,y}(t) = \begin{cases} e^{-|x-y|/t}, & t > 0\\ 0, & t = 0 \end{cases}$$
 (5)

for every $x, y \in X$. Then (X, F, Δ) is a Menger Probabilistic Metric (for short PM) space given in [24].

Definition 5 (see [4, 25]). Let (X, F, Δ) be a Menger space.

- (i) A sequence (x_n) in X is said to be convergent to a point $x \in X$ if, for every > 0, $\lim_{n \to \infty} F_{x_n,x}(t) = 1$.
- (ii) A sequence (x_n) in X is called Cauchy sequence if, for each $0 < \varepsilon < 1$ and t > 0, there exists $n_0 \in N$ $F_{x_n,x_m}(t) \ge 1 \varepsilon$ for each $n,m \ge n_0$.
- (iii) A Menger space in which every Cauchy sequence is convergent is said to be complete.

Lemma 6 (see [26]). If (X, F, Δ) be a Menger space where Δ is continuous t-norm, then for every fixed t > 0, if $(x_n) \longrightarrow x$, $(y_n) \longrightarrow y$, then $\lim_{n \longrightarrow \infty} F_{x_n, y_n}(t) = F_{x, y}(t)$.

Lemma 7 (see [23]). If $h: R^n \longrightarrow R$ is continuous and $(a_{\alpha,\beta})_{\alpha=1}^{\infty}$, $\beta=1,2,\ldots,n$ are such that $\liminf_{\alpha \longrightarrow \infty} a_{\alpha,\gamma}=a_{\alpha,\gamma}$ for all $\gamma\neq m$ for some m and $(a_{\alpha,\alpha})_{\alpha=1}^{\infty}$ is bounded, then, $\liminf_{\alpha \longrightarrow \infty} h(a_{\alpha,1},a_{\alpha,2},\ldots,a_{\alpha,n})=h(a_1,a_2,\ldots,\liminf_{\alpha \longrightarrow \infty} a_{\alpha,m},\ldots,a_n)$.

Let $R^+ = [0, \infty)$ and $\Phi = {\phi : \phi : R^+ \longrightarrow R^+}$. Each $\phi \in \Phi$ satisfies the following conditions:

- (1) ϕ is strict increasing,
- (2) ϕ is upper semicontinuous from the right,

(3)
$$\forall t > 0$$
, $\sum_{n=0}^{\infty} \phi^n(t) < \infty$.

If $\phi \in \Phi$, $\phi(t) \le t$ for all t > 0.

Lemma 8 (see [27]). Let (u_n) be sequence in a Menger space (X, F, Δ) , where Δ is a minimum t-norm. If there exists a function $\phi \in \Phi \ \forall t > 0$ and $n \ge 1$,

$$F_{u_n,u_{n+1}}(\phi(t)) \ge \min \left\{ F_{u_{n-1},u_n}(t), F_{u_n,u_{n+1}}(t) \right\}.$$
 (6)

Then (u_n) is a Cauchy sequence in X.

Lemma 9 (see [27]). Let (X, F, Δ) be a Menger space. If there exists a function $\phi \in \Phi \ \forall t > 0$ and $x, y \in X$,

$$F_{x,y}(\phi(t) + 0) \ge F_{x,y}(t)$$
, then $x = y$.

3. Main Results

Definition 10 (see [20]). Let (X, \leq) be a partially ordered set and $G: X^n \longrightarrow X$. G is said to have mixed monotone property if G is monotone nondecreasing in its odd arguments and it is monotone nonincreasing in its even argument. That is, for any $x^1, x^2, x^3, \ldots, x^n \in X$,

$$y^{1}, z^{1} \in X,$$

$$y^{1} \leq z^{1} \Longrightarrow$$

$$G\left(y^{1}, x^{2}, x^{3}, \dots, x^{n}\right) \leq G\left(z^{1}, x^{2}, x^{3}, \dots, x^{n}\right)$$

$$y^{2}, z^{2} \in X,$$

$$y^{2} \leq z^{2} \Longrightarrow$$

$$G\left(x^{1}, y^{2}, x^{3}, \dots, x^{n}\right) \geq G\left(x^{1}, z^{2}, x^{3}, \dots, x^{n}\right)$$

$$\vdots$$

$$y^{n}, z^{n} \in X,$$

$$y^{n} \leq z^{n} \Longrightarrow$$

$$G\left(x^{1}, x^{2}, x^{3}, \dots, y^{n}\right) \leq G\left(x^{1}, x^{2}, x^{3}, \dots, z^{n}\right)$$
(if n odd)
$$y^{n}, z^{n} \in X,$$

$$y^{n} \leq z^{n} \Longrightarrow$$

$$G\left(x^{1}, y^{2}, x^{3}, \dots, x^{n}\right) \geq G\left(x^{1}, x^{2}, x^{3}, \dots, z^{n}\right)$$
(if n even).
(7)

Definition 11 (see [20]). Let (X, \leq) be a partially ordered set and $G: X^n \longrightarrow X, g: X \longrightarrow X$. We say that G has the mixed g-monotone property if G is monotone g-nondecreasing in its odd arguments and it is monotone g-nonincreasing in its even argument. That is,

for any $x^{1}, x^{2}, x^{3}, ..., x^{n} \in X$

$$y^{1}, z^{1} \in X,$$

$$g(y^{1}) \leq g(z^{1}) \Longrightarrow$$

$$G(y^{1}, x^{2}, x^{3}, \dots, x^{n}) \leq G(z^{1}, x^{2}, x^{3}, \dots, x^{n})$$

$$y^{2}, z^{2} \in X,$$

$$g(y^{2}) \leq g(z^{2}) \Longrightarrow$$

$$G(x^{1}, y^{2}, x^{3}, \dots, x^{n}) \geq G(x^{1}, z^{2}, x^{3}, \dots, x^{n})$$

$$\vdots$$

$$y^{n}, z^{n} \in X,$$

$$g(y^{n}) \leq g(z^{n}) \Longrightarrow$$

$$G(x^{1}, x^{2}, x^{3}, \dots, y^{n}) \leq G(x^{1}, x^{2}, x^{3}, \dots, z^{n})$$
(if n odd)
$$y^{n}, z^{n} \in X,$$

$$g(y^{n}) \leq g(z^{n}) \Longrightarrow$$

$$G(x^{1}, y^{2}, x^{3}, \dots, x^{n}) \geq G(x^{1}, x^{2}, x^{3}, \dots, z^{n})$$
(if n even).

If g is taken identity mapping Definition 11 reduces to Definition 10.

(8)

Definition 12 (see [28]). Let $X \neq \emptyset$. An element $(x^1, x^2, x^3, \ldots, x^n) \in X^n$ is defined as a n-tuplet fixed point of the mapping $G: X^n \longrightarrow X$ if

$$G(x^{1}, x^{2}, x^{3}, ..., x^{n}) = x^{1}$$

$$G(x^{2}, x^{3}, ..., x^{n}, x^{1}) = x^{2}$$

$$\vdots$$

$$G(x^{n}, x^{1}, x^{2}, ..., x^{n-1}) = x^{n}.$$
(9)

Definition 13 (see [28]). Let $X \neq \emptyset$. An element $(x^1, x^2, x^3, \ldots, x^n) \in X^n$ is defined as a n-tuplet coincidence point of the mapping $G: X^n \longrightarrow X$ and $g: X \longrightarrow X$ if

$$G(x^{1}, x^{2}, x^{3}, ..., x^{n}) = g(x^{1})$$

$$G(x^{2}, x^{3}, ..., x^{n}, x^{1}) = g(x^{2})$$

$$\vdots$$

$$G(x^{n}, x^{1}, x^{2}, ..., x^{n-1}) = g(x^{n}).$$
(10)

When g is taken identity mapping Definition 13 reduces to Definition 12.

Definition 14 (see [20]). Let (X, \leq) be a partially ordered set and $G: X^n \longrightarrow X$ and $g: X \longrightarrow X$ is called commutative if for all $x^1, x^2, x^3, \dots, x^n \in X$

$$g\left(G\left(x^{1}, x^{2}, x^{3}, \dots, x^{n}\right)\right)$$

$$= G\left(g\left(x^{1}\right), g\left(x^{2}\right), g\left(x^{3}\right), \dots, g\left(x^{n}\right)\right).$$
(11)

Definition 15. Let (X, F, Δ) be a Menger space. $G: X^n \longrightarrow X$ and $g: X \longrightarrow X$ are said to be compatible if for all t > 0

$$\lim_{k \to \infty} F_{g(G(x_k^1, \dots, x_k^n)), G(g(x_k^1), \dots, g(x_k^n))}(t) = 1,$$

$$\lim_{k \to \infty} F_{g(G(x_k^2, \dots, x_k^n, x_k^1)), G(g(x_k^1), \dots, g(x_k^n), g(x_k^1))}(t) = 1,$$

$$\vdots$$

$$\lim_{k \to \infty} F_{g(G(x_k^n, x_k^1, \dots, x_k^{n-1})), G(g(x_k^n), g(x_k^1), \dots, g(x_k^{n-1}))}(t) = 1,$$

$$(12)$$

whenever $(x_k^1), (x_k^2), \dots, (x_k^n)$ sequences in X such that

$$\lim_{k \to \infty} G\left(x_k^1, x_k^2, \dots, x_k^n\right) = \lim_{k \to \infty} g\left(x_k^1\right) = x^1,$$

$$\lim_{k \to \infty} G\left(x_k^2, \dots, x_k^n, x_k^1\right) = \lim_{k \to \infty} g\left(x_k^2\right) = x^2,$$

$$\vdots$$

$$\lim_{k \to \infty} G\left(x_k^n, x_k^1, \dots, x_k^{n-1}\right) = \lim_{k \to \infty} g\left(x_k^n\right) = x^n.$$
(13)

Theorem 16. Let (X, \leq) be a partially ordered set and (X, F, Δ) be a complete Menger space, where Δ is a minimum t-norm. Let

 $G: X^n \longrightarrow X, g: X \longrightarrow X$ be two mappings such that G has

the mixed g-monotone property. Suppose there exist $\phi \in \Phi$ and $p \ge 0$ such that

$$F_{G(x^{1},x^{2},...,x^{n}),G(y^{1},y^{2},...,y^{n})}(\phi(t)) + p(1)$$

$$- \max \left\{ F_{g(x^{1}),G(y^{1},y^{2},...,y^{n})}(\phi(t)), \right.$$

$$F_{g(y^{1}),G(x^{1},x^{2},...,x^{n})}(\phi(t)) \right\} \ge \min \left\{ F_{g(x^{1}),g(y^{1})}(t), \right.$$

$$F_{g(x^{1}),G(x^{1},x^{2},...,x^{n})}(t), F_{g(y^{1}),G(y^{1},y^{2},...,y^{n})}(t) \right\}$$

$$F_{g(x^{1}),G(x^{1},x^{2},...,x^{n})}(t), F_{g(y^{1}),G(y^{1},y^{2},...,y^{n})}(t)$$

$$F_{g(x^{1}),G(x^{1},x^{2},...,x^{n})}(t), F_{g(y^{1}),G(y^{1},y^{2},...,y^{n})}(t)$$

for all $t > 0, x^1, x^2, ..., x^n, y^1, y^2, ..., y^n \in X$ with

$$g(x^{1}) \ge g(y^{1})$$

$$g(x^{2}) \le g(y^{2})$$

$$\vdots \qquad (15)$$

$$g(x^n) \ge g(y^n)$$
 (if n is odd)
 $g(x^n) \le g(y^n)$ (if n is even)

Assume that g is continuous, monotonic increasing, compatible with G such that $G(X^n) \subseteq g(X)$ and suppose either

- (a) G is continuous or
- (b) *X* has the following property:
 - (i) if nondecreasing sequence $(x_n) \longrightarrow x$, then $x_n \le x$ for all $n \ge 0$,
 - (ii) if nondecreasing sequence $(y_n) \longrightarrow y$, then $y_n \le y$ for all $n \ge 0$.

If there exist $x_0^1, x_0^2, \dots, x_0^n \in X$ such that

$$g(x_0^1) \le G(x_0^1, x_0^2, \dots, x_0^n)$$

$$g(x_0^2) \ge G(x_0^2, x_0^3, \dots, x_0^n, x_0^1)$$

$$\vdots \tag{16}$$

$$g(x_0^n) \le G(x_0^n, x_0^1, x_0^2, \dots, x_0^{n-1}) \quad (if \ n \ is \ odd)$$
$$g(x_0^n) \ge G(x_0^n, x_0^1, x_0^2, \dots, x_0^{n-1}) \quad (if \ n \ is \ even)$$

then there exist $x^1, x^2, \dots, x^n \in X$ such that

$$G(x^{1}, x^{2}, x^{3}, ..., x^{n}) = g(x^{1}),$$

$$G(x^{2}, x^{3}, ..., x^{n}, x^{1}) = g(x^{2}),$$

$$\vdots$$

$$G(x^{n}, x^{1}, x^{2}, ..., x^{n-1}) = g(x^{n}).$$
(17)

That is, G and g have a n-tuplet coincidence point.

Proof. Let $x_0^1, x_0^2, \ldots, x_0^n \in X$ satisfy condition (16). Since $G(X^n) \subset g(X)$, we can define $(x_k^1), (x_k^2), \ldots, (x_k^n) \in X$ sequences as follows:

for
$$k = 1, 2, 3, ...,$$

$$g(x_k^1) = G(x_{k-1}^1, x_{k-1}^2, ..., x_{k-1}^n)$$

$$g(x_k^2) = G(x_{k-1}^2, x_{k-1}^3, ..., x_{k-1}^n, x_{k-1}^1)$$

$$\vdots$$

$$g(x_k^n) = G(x_{k-1}^n, x_{k-1}^1, ..., x_{k-1}^{n-1}).$$
(18)

Next step, we show that, for all $k \ge 1$,

$$g\left(x_{k-1}^{1}\right) \leq g\left(x_{k}^{1}\right)$$

$$g\left(x_{k-1}^{2}\right) \geq g\left(x_{k}^{2}\right)$$

$$\vdots$$

$$g\left(x_{k-1}^{n}\right) \leq g\left(x_{k}^{n}\right) \quad \text{(if } n \text{ is odd)}$$

$$g\left(x_{k-1}^{n}\right) \geq g\left(x_{k}^{n}\right) \quad \text{(if } n \text{ is even)}.$$

$$(19)$$

To prove this claim, we will use the inductive method for mathematics. Because of the inequalities in (16), (19) holds for k = 1. We have

$$g(x_0^1) \le G(x_0^1, x_0^2, \dots, x_0^n) = g(x_1^1),$$

$$g(x_0^2) \ge G(x_0^2, x_0^3, \dots, x_0^n, x_0^1) = g(x_1^2),$$

$$\vdots$$

$$g(x_0^n) \le G(x_0^n, x_0^1, x_0^2, \dots, x_0^{n-1}) = g(x_1^n) \quad \text{(if } n \text{ is odd)},$$

Let us assume that (19) is true for k = m; that is,

 $g(x_0^n) \ge G(x_0^n, x_0^1, x_0^2, \dots, x_0^{n-1}) = g(x_1^n)$ (if *n* is even).

$$g\left(x_{m-1}^{1}\right) \leq g\left(x_{m}^{1}\right),$$

$$g\left(x_{m-1}^{2}\right) \geq g\left(x_{m}^{2}\right),$$

$$\vdots$$

$$g\left(x_{m-1}^{n}\right) \leq g\left(x_{m}^{n}\right) \quad \text{(if } n \text{ is odd)}$$

$$g\left(x_{m-1}^{n}\right) \geq g\left(x_{m}^{n}\right) \quad \text{(if } n \text{ is even)}.$$

Since G has the mixed g-monotone property and from (21),

$$g(x_{m}^{1}) = G(x_{m-1}^{1}, x_{m-1}^{2}, \dots, x_{m-1}^{n})$$

$$\leq G(x_{m}^{1}, x_{m-1}^{2}, \dots, x_{m-1}^{n})$$

$$\leq G(x_{m}^{1}, x_{m}^{2}, x_{m-1}^{3}, \dots, x_{m-1}^{n-1}, x_{m-1}^{n})$$

$$\vdots$$

$$\leq G(x_{m}^{1}, x_{m}^{2}, \dots, x_{m}^{n-1}, x_{m}^{n}) = g(x_{m+1}^{1}).$$

$$(22)$$

Similar way we get

$$g(x_{m}^{2}) = G(x_{m-1}^{2}, \dots, x_{m-1}^{n}, x_{m-1}^{1})$$

$$\geq G(x_{m}^{2}, x_{m-1}^{3}, \dots, x_{m-1}^{n}, x_{m-1}^{1})$$

$$\geq G(x_{m}^{2}, x_{m}^{3}, x_{m-1}^{4}, \dots, x_{m-1}^{n}, x_{m-1}^{1})$$

$$\vdots$$

$$\geq G(x_{m}^{2}, x_{m}^{3}, \dots, x_{m}^{n}, x_{m}^{1}) = g(x_{m+1}^{2}).$$

$$\vdots$$

$$g(x_{m}^{n}) \leq G(x_{m}^{n}, x_{m}^{1}, \dots, x_{m}^{n-1}) = g(x_{m+1}^{n})$$
(if n is odd)
$$g(x_{m}^{n}) \geq G(x_{m}^{n}, x_{m}^{1}, \dots, x_{m}^{n-1}) = g(x_{m+1}^{n})$$
(if n is even).

So, inequalities in (19) are true for all $k \ge 1$.

$$\cdots \ge g\left(x_{k}^{1}\right) \ge g\left(x_{k-1}^{1}\right) \ge \cdots \ge g\left(x_{1}^{1}\right) \ge g\left(x_{0}^{1}\right)$$

$$\cdots \le g\left(x_{k}^{2}\right) \le g\left(x_{k-1}^{2}\right) \le \cdots \le g\left(x_{1}^{2}\right) \le g\left(x_{0}^{2}\right)$$

$$\vdots \qquad (24)$$

$$\begin{split} &\cdots \geq g\left(x_k^n\right) \geq g\left(x_{k-1}^n\right) \geq \cdots \geq g\left(x_1^n\right) \geq g\left(x_0^n\right) \quad \text{(if n is odd)} \\ &\cdots \leq g\left(x_k^n\right) \leq g\left(x_{k-1}^n\right) \leq \cdots \leq g\left(x_1^n\right) \leq g\left(x_0^n\right) \quad \text{(if n is even)} \,. \end{split}$$

Now, we will show that $(g(x_k^1)), (g(x_k^2)), \dots, (g(x_k^n))$ are Cauchy sequences.

For all $t > 0, n \ge 1$,

$$\begin{split} F_{g(x_{k}^{1}),g(x_{k+1}^{1})}\left(\phi\left(t\right)\right) \\ &= F_{G(x_{k-1}^{1},x_{k-1}^{2},\dots,x_{k-1}^{n}),G(x_{k}^{1},x_{k}^{2},\dots,x_{k}^{n})}\left(\phi\left(t\right)\right) \\ &\geq \min\left\{F_{g(x_{k-1}^{1}),g(x_{k}^{1})}\left(t\right),F_{g(x_{k-1}^{1}),G(x_{k-1}^{1},x_{k-1}^{2},\dots,x_{k-1}^{n})}\left(t\right),\\ F_{g(x_{k}^{1}),G(x_{k}^{1},x_{k}^{2},\dots,x_{k}^{n})}\left(t\right)\right\} \\ &- p\left(1-\max\left\{F_{g(x_{k-1}^{1}),G(x_{k}^{1},x_{k}^{2},\dots,x_{k}^{n})}\left(\phi\left(t\right)\right),\\ F_{g(x_{k}^{1}),G(x_{k-1}^{1},x_{k-1}^{2},\dots,x_{k-1}^{n})}\left(\phi\left(t\right)\right)\right\}\right) \\ &= \min\left\{F_{g(x_{k-1}^{1}),g(x_{k}^{1})}\left(t\right),F_{g(x_{k-1}^{1}),g(x_{k}^{1})}\left(t\right),\\ F_{g(x_{k}^{1}),g(x_{k+1}^{1})}\left(t\right)\right\} \\ &- p\left(1-\max\left\{F_{g(x_{k-1}^{1}),g(x_{k+1}^{1})}\left(\phi\left(t\right)\right),\\ F_{g(x_{k}^{1}),g(x_{k}^{1})}\left(\phi\left(t\right)\right)\right\}\right) \\ F_{g(x_{k}^{1}),g(x_{k+1}^{1})}\left(\phi\left(t\right)\right) &\geq \min\left\{F_{g(x_{k-1}^{1}),g(x_{k}^{1})}\left(t\right),\\ F_{g(x_{k}^{1}),g(x_{k+1}^{1})}\left(\phi\left(t\right)\right)\right\} - p\left(1-1\right) \end{split}$$

$$F_{g(x_{k}^{1}),g(x_{k+1}^{1})}\left(\phi\left(t\right)\right) \geq \min\left\{F_{g(x_{k-1}^{1}),g(x_{k}^{1})}\left(t\right),\right.$$

$$F_{g(x_{k}^{1}),g(x_{k+1}^{1})}\left(t\right)\right\}.$$
(25)

By Lemma 8, we obtain that $(g(x_k^1))$ is a Cauchy sequence.

$$\begin{split} F_{g(x_{k}^{2}),g(x_{k+1}^{2})}\left(\phi\left(t\right)\right) &= F_{G(x_{k-1}^{2},x_{k-1}^{3},...,x_{k-1}^{n},x_{k-1}^{1}),G(x_{k}^{2},x_{k}^{3},...,x_{k}^{n},x_{k}^{1})}\left(\phi\left(t\right)\right) \\ &\geq \min\left\{F_{g(x_{k-1}^{2}),g(x_{k}^{2})}\left(t\right),F_{g(x_{k-1}^{2}),G(x_{k-1}^{2},x_{k-1}^{3},...,x_{k-1}^{n},x_{k-1}^{1})}\left(t\right),\\ F_{g(x_{k}^{2}),G(x_{k}^{2},x_{k}^{3},...,x_{k}^{n},x_{k}^{1})}\left(t\right)\right\} \\ &- p\left(1-\max\left\{F_{g(x_{k-1}^{2}),G(x_{k}^{2},x_{k}^{3},...,x_{k-1}^{n},x_{k-1}^{1})}\left(\phi\left(t\right)\right)\right\}\right) \\ &= \min\left\{F_{g(x_{k}^{2}),G(x_{k-1}^{2},x_{k-1}^{3},...,x_{k-1}^{n},x_{k-1}^{1})}\left(\phi\left(t\right)\right)\right\}\right) \\ &= \min\left\{F_{g(x_{k}^{2}),g(x_{k-1}^{2}),g(x_{k}^{2})}\left(t\right),F_{g(x_{k-1}^{2}),g(x_{k}^{2})}\left(t\right),\\ F_{g(x_{k}^{2}),g(x_{k+1}^{2})}\left(t\right)\right\} \\ &- p\left(1-\max\left\{F_{g(x_{k-1}^{2}),g(x_{k+1}^{2})}\left(\phi\left(t\right)\right)\right\}\right) \\ F_{g(x_{k}^{2}),g(x_{k}^{2})}\left(\phi\left(t\right)\right)\right\}\right) \\ F_{g(x_{k}^{2}),g(x_{k+1}^{2})}\left(\phi\left(t\right)\right) \geq \min\left\{F_{g(x_{k-1}^{2}),g(x_{k}^{2})}\left(t\right),\\ F_{g(x_{k}^{2}),g(x_{k+1}^{2})}\left(t\right)\right\}. \end{split}$$

We obtain that $(g(x_k^2))$ is a Cauchy sequence.

Using same way we conclude that $(g(x_k^3)), \ldots, (g(x_k^n))$ are also Cauchy sequences. Since X is complete metric space, there exist $x^1, x^2, \ldots, x^n \in X$ such that

$$\lim_{k \to \infty} g\left(x_k^1\right) = x^1,$$

$$\lim_{k \to \infty} g\left(x_k^2\right) = x^2,$$

$$\vdots$$

$$\lim_{k \to \infty} g\left(x_k^n\right) = x^n.$$
(27)

Since *q* is continuous, we can write

$$\lim_{k \to \infty} g\left(g\left(x_{k}^{1}\right)\right) = g\left(x^{1}\right),$$

$$\lim_{k \to \infty} g\left(g\left(x_{k}^{2}\right)\right) = g\left(x^{2}\right),$$

$$\vdots$$

$$\lim_{k \to \infty} g\left(g\left(x_{k}^{n}\right)\right) = g\left(x^{n}\right).$$
(28)

As (G, g) is compatible and g is continuous,

$$g(x^{1}) = \lim_{k \to \infty} g(g(x_{k+1}^{1}))$$

$$= \lim_{k \to \infty} g(G(x_{k}^{1}, x_{k}^{2}, \dots, x_{k}^{n}))$$

$$= \lim_{k \to \infty} G(g(x_{k}^{1}), g(x_{k}^{2}), \dots, g(x_{k}^{n})),$$

$$g(x^{2}) = \lim_{k \to \infty} g(g(x_{k+1}^{2}))$$

$$= \lim_{k \to \infty} g(G(x_{k}^{2}, \dots, x_{k}^{n}, x_{k}^{1}))$$

$$= \lim_{k \to \infty} G(g(x_{k}^{2}), \dots, g(x_{k}^{n}), g(x_{k}^{1})),$$

$$\vdots$$

$$g(x^{n}) = \lim_{k \to \infty} g(g(x_{k+1}^{n}))$$

$$= \lim_{k \to \infty} g(G(x_{k}^{n}, x_{k}^{1}, \dots, x_{k}^{n-1}))$$

$$= \lim_{k \to \infty} g(G(x_{k}^{n}), g(x_{k}^{1}), \dots, g(x_{k}^{n-1})).$$
(29)

We will indicate that

$$G(x^{1}, x^{2}, \dots, x^{n}) = g(x^{1}),$$

$$G(x^{2}, x^{3}, \dots, x^{n}, x^{1}) = g(x^{2}),$$

$$\vdots$$

$$G(x^{n}, x^{1}, \dots, x^{n-1}) = g(x^{n}).$$

$$(30)$$

Suppose that (a) holds. From (27), (28), and (29),

$$g(x^{1}) = \lim_{k \to \infty} G(g(x_{k}^{1}), g(x_{k}^{2}), \dots, g(x_{k}^{n}))$$

$$= G\left(\lim_{k \to \infty} g(x_{k}^{1}), \lim_{k \to \infty} g(x_{k}^{2}), \dots, \lim_{k \to \infty} g(x_{k}^{n})\right)$$

$$= G(x^{1}, x^{2}, \dots, x^{n})$$

$$g(x^{2}) = \lim_{k \to \infty} G(g(x_{k}^{2}), g(x_{k}^{3}), \dots, g(x_{k}^{n}), g(x_{k}^{1}))$$

$$= G\left(\lim_{k \to \infty} g(x_{k}^{2}), \lim_{k \to \infty} g(x_{k}^{3}), \dots, \lim_{k \to \infty} g(x_{k}^{n}), \dots, \lim_{k \to \infty} g(x_{k}^{n}), \dots, \lim_{k \to \infty} g(x_{k}^{n}), \dots, \lim_{k \to \infty} g(x_{k}^{n})\right)$$

$$= G(x^{2}, x^{3}, \dots, x^{n}, x^{1})$$

$$\vdots$$

$$g(x^{n}) = \lim_{k \to \infty} G(g(x_{k}^{n}), g(x_{k}^{1}), \dots, g(x_{k}^{n-1}))$$

$$= G\left(\lim_{k \to \infty} g(x_{k}^{n}), \lim_{k \to \infty} g(x_{k}^{1}), \dots, \lim_{k \to \infty} g(x_{k}^{n-1})\right)$$

$$= G(x^{n}, x^{1}, \dots, x^{n-1}).$$
(31)

Now assume that (b) holds. From (19) and (29), we have for all k

$$g(x_k^1) \le x^1$$

$$g(x_k^2) \ge x^2$$

$$\vdots$$

$$g(x_k^n) \le x^n \quad \text{(if } n \text{ is odd)}$$

$$g(x_k^n) \ge x^n \quad \text{(if } n \text{ is even)}.$$

For all t > 0, $0 < \lambda < 1$, we have

$$F_{g(x^{1}),G(x^{1},x^{2},...,x^{n})}(\phi(t))$$

$$\geq \Delta \left\{ F_{g(x^{1}),g(g(x^{1}_{k+1}))}(\phi(t) - \phi(\lambda t)), \qquad (33) \right.$$

$$F_{g(g(x^{1}_{k+1})),G(x^{1},x^{2},...,x^{n})}(\phi(\lambda t)) \right\}.$$

If $g(x^1) = \lim_{k \to \infty} g(g(x^1_{k+1}))$, $\lim_{k \to \infty} F_{g(x^1),g(g(x^1_{k+1}))}(t) = 1$. When we apply limit to both parts of above inequality, we get

$$\begin{split} F_{g(x^1),G(x^1,x^2,\dots,x^n)}\left(\phi\left(t\right)\right) &\geq \lim_{k \to \infty} \inf \Delta \left\{F_{g(x^1),g(g(x^1_{k+1}))}\left(\phi\left(t\right) - \phi\left(\lambda t\right)\right), F_{g(g(x^1_{k+1})),G(x^1,x^2,\dots,x^n)}\left(\phi\left(\lambda t\right)\right)\right\} \\ &= \Delta \left\{\lim_{k \to \infty} F_{g(x^1),g(g(x^1_{k+1}))}\left(\phi\left(t\right) - \phi\left(\lambda t\right)\right), \lim_{k \to \infty} \inf F_{g(g(x^1_{k+1})),G(x^1,x^2,\dots,x^n)}\left(\phi\left(\lambda t\right)\right)\right\} = \min \left\{1, \right. \\ &\lim_{k \to \infty} \inf F_{G(g(x^1_k),g(x^2_k),\dots,g(x^1_k)),G(x^1,x^2,\dots,x^n)}\left(\phi\left(\lambda t\right)\right)\right\} = \lim_{k \to \infty} \inf F_{G(g(x^1_k),g(x^2_k),\dots,g(x^1_k)),G(x^1,x^2,\dots,x^n)}\left(\phi\left(\lambda t\right)\right) \\ &\geq \lim_{k \to \infty} \inf \left[\min \left\{F_{g(g(x^1_k)),g(x^1)}\left(\lambda t\right),F_{g(g(x^1_k)),G(g(x^1_k),g(x^2_k),\dots,g(x^n_k))}\left(\lambda t\right),F_{g(x^1),G(x^1,x^2,\dots,x^n)}\left(\lambda t\right)\right\} \right. \\ &- p\left(1 - \max \left\{F_{g(g(x^1_k)),G(x^1,x^2,\dots,x^n)}\left(\phi\left(\lambda t\right)\right),F_{g(x^1),G(g(x^1_k),g(x^2_k),\dots,g(x^n_k))}\left(\phi\left(\lambda t\right)\right)\right\}\right] = \min \left\{\lim_{k \to \infty} F_{g(g(x^1_k)),g(x^1)}\left(\lambda t\right),F_{g(x^1),G(x^1,x^2,\dots,x^n)}\left(\lambda t\right)\right\} \\ &= \lim_{k \to \infty} \inf F_{g(g(x^1_k)),G(g(x^1_k),g(x^2_k),\dots,g(x^n_k))}\left(\lambda t\right),F_{g(x^1),G(x^1,x^2,\dots,x^n)}\left(\lambda t\right)\right\} - p\left(1 - \max \left\{\lim_{k \to \infty} F_{g(g(x^1_k)),G(x^1,x^2,\dots,x^n)}\left(\phi\left(\lambda t\right)\right)\right\},F_{g(x^1),G(x^1,x^2,\dots,x^n)}\left(\lambda t\right)\right\} - p\left(1 - \max \left\{\lim_{k \to \infty} F_{g(g(x^1_k)),G(x^1,x^2,\dots,x^n)}\left(\phi\left(\lambda t\right)\right)\right\},F_{g(x^1),G(x^1,x^2,\dots,x^n)}\left(\lambda t\right)\right\} - p\left(1 - \max \left\{\lim_{k \to \infty} F_{g(g(x^1_k)),G(x^1,x^2,\dots,x^n)}\left(\phi\left(\lambda t\right)\right)\right\},F_{g(x^1),G(x^1,x^2,\dots,x^n)}\left(\lambda t\right)\right\} - p\left(1 - \max \left\{\lim_{k \to \infty} F_{g(g(x^1_k)),G(x^1,x^2,\dots,x^n)}\left(\phi\left(\lambda t\right)\right)\right\},F_{g(x^1),G(x^1,x^2,\dots,x^n)}\left(\lambda t\right)\right\} - p\left(1 - \max \left\{\lim_{k \to \infty} F_{g(g(x^1_k)),G(x^1,x^2,\dots,x^n)}\left(\phi\left(\lambda t\right)\right)\right\},F_{g(x^1),G(x^1,x^2,\dots,x^n)}\left(\lambda t\right)\right\} - p\left(1 - \max \left\{\lim_{k \to \infty} F_{g(g(x^1_k)),G(x^1,x^2,\dots,x^n)}\left(\phi\left(\lambda t\right)\right)\right\}\right) - p\left(1 - \max \left\{\lim_{k \to \infty} F_{g(g(x^1_k)),G(x^1,x^2,\dots,x^n)}\left(\phi\left(\lambda t\right)\right)\right\}\right\}$$

$$\lim_{k \to \infty} F_{g(x^1),G(g(x_k^1),g(x_k^2),...,g(x_k^n))} \left(\phi \left(\lambda t \right) \right) = \min \left\{ F_{g(x^1),g(x^1)} \left(\lambda t \right), F_{g(x^1),g(x^1)} \left(\lambda t \right), F_{g(x^1),G(x^1,x^2,...,x^n)} \left(\lambda t \right) \right\} - p \left(1 - \max \left\{ F_{g(x^1),G(x^1,x^2,...,x^n)} \left(\phi \left(\lambda t \right) \right), F_{g(x^1),g(x^1)} \left(\phi \left(\lambda t \right) \right) \right\} \right) \geq \min \left\{ 1, F_{g(x^1),G(x^1,x^2,...,x^n)} \left(\lambda t \right) \right\} - p \left(1 - 1 \right)$$

$$\geq F_{g(x^1),G(x^1,x^2,...,x^n)} \left(\lambda t \right).$$

Because λ is arbitrary $0 < \lambda < 1$, by taking $\lambda \longrightarrow 1$, and left continuous property of distribution function F, we have

$$F_{q(x^1),G(x^1,x^2,...,x^n)}(\phi(t)) \ge F_{q(x^1),G(x^1,x^2,...,x^n)}(t)$$
. (35)

 ϕ is increasing and also is monotone increasing. Accordingly,

$$\phi(t) + 0 \ge \phi(t) \Longrightarrow$$

$$F_{g(x^{1}),G(x^{1},x^{2},...,x^{n})}\left(\phi(t)+0\right) \geq F_{g(x^{1}),G(x^{1},x^{2},...,x^{n})}\left(\phi(t)\right)$$
(36)
$$\geq F_{g(x^{1}),G(x^{1},x^{2},...,x^{n})}\left(t\right).$$

From Lemma 9, $g(x^1) = G(x^1, x^2, ..., x^n)$. By the same way, we can find

$$g(x^{2}) = G(x^{2}, \dots, x^{n}, x^{1}),$$

$$\vdots$$

$$g(x^{n}) = G(x^{n}, x^{1}, \dots, x^{n-1}).$$

$$(37)$$

Consequently, g and G have n-tuplet coincidence point in X.

Taking p = 0 in Theorem 16, we obtain Corollary 17.

Corollary 17. Let (X, \leq) be a partially ordered set and (X, F, Δ) be a complete Menger space, where Δ is minimum t-norm. Let $G: X^n \longrightarrow X, g: X \longrightarrow X$ be two mappings such that G has the mixed g-monotone property. Let $\phi \in \Phi$ exist such that

$$F_{G(x^{1},x^{2},...,x^{n}),G(y^{1},y^{2},...,y^{n})}\left(\phi\left(t\right)\right) \geq \min\left\{F_{g(x^{1}),g(y^{1})}\left(t\right),\right.$$

$$F_{g(x^{1}),G(x^{1},x^{2},...,x^{n})}\left(t\right),F_{g(y^{1}),G(y^{1},y^{2},...,y^{n})}\left(t\right)\right\}$$
(38)

for all $t > 0, x^1, x^2, ..., x^n, y^1, y^2, ..., y^n \in X$ with

$$g(x^{1}) \ge g(y^{1})$$
$$g(x^{2}) \le g(y^{2})$$

$$g(x^n) \ge g(y^n)$$
 (if n is odd)
 $g(x^n) \le g(y^n)$ (if n is even).

Also g is continuous, monotonic increasing, compatible with G and $G(X^n) \subseteq g(X)$. And suppose either

- (a) G is continuous or
- (b) *X* has the following properties:
 - (i) if a nondecreasing sequence $(x_n) \longrightarrow x$, then $x_n \le x \ \forall n \ge 0$,

(34)

(ii) if a nonincreasing sequence $(y_n) \longrightarrow y$, then $y_n \le y \ \forall n \ge 0$.

If there are $x_0^1, x_0^2, \dots, x_0^n \in X$ such that

$$g(x_0^1) \le G(x_0^1, x_0^2, \dots, x_0^n)$$

$$g(x_0^2) \ge G(x_0^2, x_0^3, \dots, x_0^n, x_0^1)$$

$$\vdots \tag{40}$$

$$\begin{split} g\left(x_0^n\right) &\leq G\left(x_0^n, x_0^1, \dots, x_0^{n-1}\right) \quad (if \ n \ is \ odd) \\ g\left(x_0^n\right) &\geq G\left(x_0^n, x_0^1, \dots, x_0^{n-1}\right) \quad (if \ n \ is \ even) \,, \end{split}$$

then g and G have n-tuplet coincidence point in X. That is, there exist $x^1, x^2, \dots, x^n \in X$ such that

$$G(x^{1}, x^{2}, x^{3}, \dots, x^{n}) = g(x^{1})$$

$$G(x^{2}, x^{3}, \dots, x^{n}, x^{1}) = g(x^{2})$$

$$\vdots$$

$$G(x^{n}, x^{1}, x^{2}, \dots, x^{n-1}) = g(x^{n}).$$

$$(41)$$

When we take $\phi(t) = ct$, $c \in (0,1)$ in Theorem 16, we obtain Corollary 18.

Corollary 18. Let (X, \leq) be a partially ordered set and (X, F, Δ) be a complete Menger space, where Δ is minimum t-norm. Let $G: X^n \longrightarrow X, g: X \longrightarrow X$ be two mappings such that G has the mixed g-monotone property. Let $\phi \in \Phi$ and $p \geq 0$ exist such that

$$F_{G(x^{1},x^{2},...,x^{n}),G(y^{1},y^{2},...,y^{n})}(ct) + p \left(1 - \max\left\{F_{g(x^{1}),G(y^{1},y^{2},...,y^{n})}(ct), \right.\right.$$

$$F_{g(y^{1}),G(x^{1},x^{2},...,x^{n})}(ct)\right\} \geq \min\left\{F_{g(x^{1}),g(y^{1})}(t), \right.$$

$$F_{g(x^{1}),G(x^{1},x^{2},...,x^{n})}(t), F_{g(y^{1}),G(y^{1},y^{2},...,y^{n})}(t)\right\}$$

$$(42)$$

for all
$$t > 0$$
, $x^1, x^2, ..., x^n, y^1, y^2, ..., y^n \in X$ with
$$g(x^1) \ge g(y^1)$$

$$g(x^2) \le g(y^2)$$

$$\vdots$$

$$g(x^n) \ge g(y^n) \quad (if \ n \ is \ odd)$$

$$g(x^n) \le g(y^n) \quad (if \ n \ is \ even).$$
(43)

Also g is continuous, monotonic increasing, compatible with G and $G(X^n) \subseteq g(X)$. And suppose either

- (a) G is continuous or
- (b) *X* has the following properties:
 - (i) if a nondecreasing sequence $(x_n) \longrightarrow x$, then $x_n \le x \ \forall n > 0$.
 - (ii) if a nonincreasing sequence $(y_n) \longrightarrow y$, then $y_n \le y \ \forall n > 0$.

If there are
$$x_0^1, x_0^2, \dots, x_0^n \in X$$
 such that
$$g(x_0^1) \le G(x_0^1, x_0^2, \dots, x_0^n)$$
$$g(x_0^2) \ge G(x_0^2, x_0^3, \dots, x_0^n, x_0^1)$$

$$g(x_0^n) \le G(x_0^n, x_0^1, \dots, x_0^{n-1})$$
 (if n is odd)
 $g(x_0^n) \ge G(x_0^n, x_0^1, \dots, x_0^{n-1})$ (if n is even),

then g and G have n-tuplet coincidence point in X. That is, there exist $x^1, x^2, \dots, x^n \in X$ such that

$$G(x^{1}, x^{2}, x^{3}, ..., x^{n}) = g(x^{1})$$

$$G(x^{2}, x^{3}, ..., x^{n}, x^{1}) = g(x^{2})$$

$$\vdots$$

$$G(x^{n}, x^{1}, x^{2}, ..., x^{n-1}) = g(x^{n}).$$
(45)

4. Uniqueness of *n*-Tuplet Fixed Point

For all
$$(x^{1}, x^{2}, ..., x^{n}), (x^{1*}, x^{2*}, ..., x^{n*}) \in X^{n},$$

$$(x^{1}, x^{2}, ..., x^{n}) \leq (x^{1*}, x^{2*}, ..., x^{n*}) \Longleftrightarrow$$

$$x^{1} \leq x^{1*},$$

$$x^{2} \geq x^{2*},$$

$$\vdots$$

$$x^{n} \leq x^{n*} \quad (\text{if } n \text{ is odd}),$$

$$x^{n} \geq x^{n*} \quad (\text{if } n \text{ is even}).$$
(46)

$$(x^1, x^2, ..., x^n)$$
 is equal to $(x^{1*}, x^{2*}, ..., x^{n*})$ iff $x^1 = x^{1*}, x^2 = x^{2*}, ..., x^n = x^{n*}$.

Theorem 19. In addition to the hypotheses of Theorem 16, suppose that for all $(x^1, x^2, ..., x^n), (x^{1*}, x^{2*}, ..., x^{n*}) \in X^n$ there exist $(y^1, y^2, ..., y^n) \in X^n$ such that

$$(G(y^{1}, y^{2}, ..., y^{n}), G(y^{2}, ..., y^{n}, y^{1}), ..., G(y^{n}, y^{1}, ..., y^{n-1}))$$
(47)

is comparable to

$$(G(x^{1}, x^{2}, ..., x^{n}), G(x^{2}, ..., x^{n}, x^{1}), ..., G(x^{n}, x^{1}, ..., x^{n-1}))$$
(48)

and

(44)

$$(G(x^{1*}, x^{2*}, \dots, x^{n*}), G(x^{2*}, \dots, x^{n*}, x^{1*}), \dots, G(x^{n*}, x^{1*}, \dots, x^{(n-1)*})).$$

$$(49)$$

Then g and G have a unique n-tuplet common fixed point; that is, there exist $(x^1, x^2, ..., x^n) \in X^n$ such that

$$x^{1} = g(x^{1}) = G(x^{1}, x^{2}, x^{3}, ..., x^{n}),$$

$$x^{2} = g(x^{2}) = G(x^{2}, x^{3}, ..., x^{n}, x^{1}),$$

$$\vdots$$

$$x^{n} = g(x^{n}) = G(x^{n}, x^{1}, x^{2}, ..., x^{n-1}).$$
(50)

Proof. The set of *n*-tuplet coincidence points is nonempty due to Theorem 16. We shall show that if $(x^1, x^2, ..., x^n)$ and $(x^{1*}, x^{2*}, ..., x^{n*})$ are *n*-tuplet coincidence points, that is, if

$$g(x^{1}) = G(x^{1}, x^{2}, \dots, x^{n}),$$

$$g(x^{2}) = G(x^{2}, \dots, x^{n}, x^{1}),$$

$$\vdots$$

$$g(x^{n}) = G(x^{n}, x^{1}, \dots, x^{n-1})$$
(51)

and

$$g(x^{1*}) = G(x^{1*}, x^{2*}, \dots, x^{n*}),$$

$$g(x^{2*}) = G(x^{2*}, \dots, x^{n*}, x^{1*}),$$

$$\vdots$$

$$g(x^{n*}) = G(x^{n*}, x^{1*}, \dots, x^{(n-1)*}),$$
(52)

then

$$g(x^{1}) = g(x^{1*}),$$

$$g(x^{2}) = g(x^{2*}),$$

$$\vdots$$

$$g(x^{n}) = g(x^{n*}).$$
(53)

By assumption there is $(y^1, y^2, ..., y^n) \in X^n$ such that

$$(G(y^{1}, y^{2}, ..., y^{n}), G(y^{2}, ..., y^{n}, y^{1}), ..., G(y^{n}, y^{1}, ..., y^{n-1}))$$
(54)

is comparable to

$$\frac{\left(G\left(x^{1}, x^{2}, \dots, x^{n}\right), G\left(x^{2}, \dots, x^{n}, x^{1}\right), \dots, G\left(x^{n}, x^{1}, \dots, x^{n-1}\right)\right)}{G\left(x^{n}, x^{1}, \dots, x^{n-1}\right)\right)}$$
(55)

and

$$(G(x^{1*}, x^{2*}, \dots, x^{n*}), G(x^{2*}, \dots, x^{n*}, x^{1*}), \dots, G(x^{n*}, x^{1*}, \dots, x^{(n-1)*})).$$
(56)

We can determine sequences $(g(y_k^1)), (g(y_k^2)), \dots, (g(y_k^n))$ such that $y^1 = y_0^1, y^2 = y_0^2, \dots, y^n = y_0^n$ and

$$g(y_{k}^{1}) = G(y_{k-1}^{1}, y_{k-1}^{2}, \dots, y_{k-1}^{n}),$$

$$g(y_{k}^{2}) = G(y_{k-1}^{2}, \dots, y_{k-1}^{n}, y_{k-1}^{1}),$$

$$\vdots$$

$$g(y_{k}^{n}) = G(y_{k-1}^{n}, y_{k-1}^{1}, \dots, y_{k-1}^{n-1}).$$
(57)

From comparability of (56) and (55) with (54), we suppose that

$$(g(x^{1}), g(x^{2}), \dots, g(x^{n}))$$

$$\geq (g(y^{1}), g(y^{2}), \dots, g(y^{n}))$$

$$= (g(y_{0}^{1}), g(y_{0}^{2}), \dots, g(y_{0}^{n})).$$
(58)

Using (24), we have

$$(g(x^{1}), g(x^{2}), \dots, g(x^{n}))$$

$$\geq (g(y_{k}^{1}), g(y_{k}^{2}), \dots, g(y_{k}^{n})) \quad \text{for all } k.$$

$$(59)$$

Also from (46), we get

$$\begin{split} g\left(x^{1}\right) &\geq g\left(y_{k}^{1}\right), \\ g\left(x^{2}\right) &\leq g\left(y_{k}^{2}\right), \\ &\vdots \\ g\left(x^{n}\right) \geq g\left(y_{k}^{n}\right) \quad (\text{if } n \text{ is odd}), \\ g\left(x^{n}\right) &\leq g\left(y_{k}^{n}\right) \quad (\text{if } n \text{ is even}). \\ &F_{g(x^{1}),g(y_{k+1}^{1})}\left(\phi\left(t\right)\right) = F_{G(x^{1},x^{2},...,x^{n}),G(y_{k}^{1},y_{k}^{2},...,y_{k}^{n})}\left(\phi\left(t\right)\right) \\ &\geq \min\left\{F_{g(x^{1}),g(y_{k}^{1})}\left(t\right), F_{g(x^{1}),G(x^{1},x^{2},...,x^{n})}\left(t\right), \\ &F_{g(y_{k}^{1}),G(y_{k}^{1},y_{k}^{2},...,y_{k}^{n})}\left(t\right)\right\} - p\left(1 \\ &- \max\left\{F_{g(x^{1}),G(y_{k}^{1},y_{k}^{2},...,y_{k}^{n})}\left(\phi\left(t\right)\right)\right\} \right) = \min\left\{F_{g(x^{1}),g(y_{k}^{1})}\left(t\right), \\ &F_{g(x^{1}),G(x^{1},x^{2},...,x^{n})}\left(\phi\left(t\right)\right)\right\} - p\left(1 \\ &- \max\left\{F_{g(x^{1}),g(y_{k}^{1})}\left(t\right), F_{g(y_{k}^{1}),g(y_{k+1}^{1})}\left(t\right)\right\} - p\left(1 \\ &- \max\left\{F_{g(x^{1}),g(y_{k}^{1})}\left(t\right), F_{g(y_{k}^{1}),g(y_{k}^{1})}\left(\phi\left(t\right)\right)\right\}\right) \\ &\geq \min\left\{F_{g(x^{1}),g(y_{k}^{1})}\left(t\right), F_{g(y_{k}^{1}),g(y_{k+1}^{1})}\left(t\right)\right\}, \\ &F_{g(x^{2}),g(y_{k+1}^{2})}\left(\phi\left(t\right)\right) \\ &= F_{G(x^{2},x^{3},...,x^{n},x^{1}),G(y_{k}^{2},y_{k}^{3},...,y_{k}^{n},y_{k}^{1})}\left(\phi\left(t\right)\right), \\ &F_{g(y_{k}^{2}),G(y_{k}^{2},y_{k}^{3},...,y_{k}^{n},y_{k}^{1})}\left(\phi\left(t\right)\right), \\ &F_{g(y_{k}^{2}),G(y_{k}^{2},y_{k}^{3},...,y_{k}^{n},y_{k}^{1})}\left(\phi\left(t\right)\right), \\ &F_{g(x^{2}),g(x^{2})}\left(t\right), F_{g(y_{k}^{2}),g(y_{k+1}^{2})}\left(t\right)\right\} - p\left(1 \\ &- \max\left\{F_{g(x^{2}),g(y_{k}^{2})}\left(t\right), F_{g(y_{k}^{2}),g(y_{k+1}^{2})}\left(t\right)\right\} - p\left(1 \\ &- \max\left\{F_{g(x^{2}),g(y_{k}^{2})}\left(t\right), F_{g(y_{k}^{2}),g(y_{k+1}^{2})}\left(t\right)\right\}\right\} \\ &\geq \min\left\{F_{g(x^{2}),g(y_{k}^{2})}\left(t\right), F_{g(y_{k}^{2}),g(y_{k+1}^{2})}\left(t\right)\right\}, \\ &\vdots \\ &F_{g(x^{n}),g(y_{k+1}^{n})}\left(\phi\left(t\right)\right) \\ &\geq \min\left\{F_{g(x^{n},y_{k}^{2},...,y_{k}^{n-1})}\left(t\right), F_{g(x^{n},y_{k}^{2},...,y_{k}^{n-1})}\left(t\right)\right\}, \\ &\geq \min\left\{F_{g(x^{n},y_{k}^{2},...,y_{k}^{n-1})}\left(t\right), F_{g(y_{k}^{2}),g(y_{k+1}^{2})}\left(t\right)\right\}, \\ &\in \left(F_{g(x^{n},y_{k}^{2},...,y_{k}^{n-1})}\left(t\right), F_{g(y_{k}^{n}),g(x_{k}^{n-1})}\left(t\right)\right\}, \\ &\in \left(F_{g(x^{n},y_{k}^{2},...,y_{k}^{n-1})}\left(t\right)\right), F_{g(x^{n},y_{k}^{2},...,y_{k}^{n-1})}\left(t\right)\right\}, \\ &\in \left(F_{g(x^{n},y_{k}^{2},...,y_{k}^{n-1})}\left(t\right)\right), F_{g(y_{k}^{n},y_{k}^{2},...,y_{k}^{n-1})}\left(t\right)\right\}, \\ &\in \left(F_{g(x$$

 $-\max\left\{F_{q(x^{n}),G(y_{\iota}^{n},y_{\iota}^{1},...,y_{\iota}^{n-1})}\left(\phi\left(t\right)\right),\right.$

9

$$F_{g(y_{k}^{n}),G(x^{n},x^{1},...,x^{n-1})}(\phi(t))\}) = \min \left\{F_{g(x^{n}),g(y_{k}^{n})}(t), F_{g(y_{k}^{n}),g(y_{k+1}^{n})}(t)\right\} - p\left(1 - \max \left\{F_{g(x^{n}),g(y_{k+1}^{n})}(\phi(t)), F_{g(y_{k}^{n}),g(x^{n})}(\phi(t))\right\}\right)$$

$$\geq \min \left\{F_{g(x^{n}),g(y_{k+1}^{n})}(t), F_{g(y_{k}^{n}),g(y_{k+1}^{n})}(t)\right\}$$
(60)

for each $k \ge 1$. If we take lower limit when $k \longrightarrow \infty$ from Lemmas 8 and 9, we have

$$\lim_{k \to \infty} g\left(y_{k+1}^{1}\right) = g\left(x^{1}\right),$$

$$\lim_{k \to \infty} g\left(y_{k+1}^{2}\right) = g\left(x^{2}\right),$$

$$\vdots$$

$$\lim_{k \to \infty} g\left(y_{k+1}^{n}\right) = g\left(x^{n}\right).$$
(61)

Likewise, one can show that

$$\lim_{k \to \infty} g\left(y_{k+1}^{1}\right) = g\left(x^{1*}\right),$$

$$\lim_{k \to \infty} g\left(y_{k+1}^{2}\right) = g\left(x^{2*}\right),$$

$$\vdots$$

$$\lim_{k \to \infty} g\left(y_{k+1}^{n}\right) = g\left(x^{n*}\right).$$
(62)

Using (61), (62), and triangle inequality property,

$$\begin{split} F_{g(x^1),g(x^{1*})}\left(t\right) \\ &\geq \Delta\left\{F_{g(x^1),g(y^1_{k+1})}\left(\frac{t}{2}\right),F_{g(y^1_{k+1}),g(x^{1*})}\left(\frac{t}{2}\right)\right\} \longrightarrow 1 \\ &\qquad (k\longrightarrow \infty)\,, \end{split}$$

$$F_{g(x^{2}),g(x^{2^{*}})}(t)$$

$$\geq \Delta \left\{ F_{g(x^{2}),g(y_{k+1}^{2})} \left(\frac{t}{2} \right), F_{g(y_{k+1}^{2}),g(x^{2^{*}})} \left(\frac{t}{2} \right) \right\} \longrightarrow 1$$

$$(k \longrightarrow \infty),$$
(63)

$$\begin{split} F_{g(x^n),g(x^{n*})}\left(t\right) \\ &\geq \Delta\left\{F_{g(x^n),g(y^n_{k+1})}\left(\frac{t}{2}\right),F_{g(y^n_{k+1}),g(x^{n*})}\left(\frac{t}{2}\right)\right\} \longrightarrow 1 \\ &\qquad (k \longrightarrow \infty) \,. \end{split}$$

So, we have

$$g(x^1) = g(x^{1*}), g(x^2) = g(x^{2*}), \dots, g(x^n) = g(x^{n*}).$$
 Thus, we showed (53).

Using commutativity of G and g,

$$g(g(x^{1})) = g(G(x^{1}, x^{2}, ..., x^{n}))$$

$$= G(g(x^{1}), g(x^{2}), ..., g(x^{n})),$$

$$g(g(x^{2})) = g(G(x^{2}, ..., x^{n}, x^{1}))$$

$$= G(g(x^{2}), ..., g(x^{n}), g(x^{1})),$$

$$\vdots$$

$$g(g(x^{n})) = g(G(x^{n}, x^{1}, ..., x^{n-1}))$$

$$= G(g(x^{n}), g(x^{1}), ..., g(x^{n-1})).$$
(64)

Indicate
$$g(x^{1}) = z^{1}, g(x^{2}) = z^{2}, ..., g(x^{n}) = z^{n}$$
. From (64),

$$g(z^{1}) = G(z^{1}, z^{2}, ..., z^{n}),$$

$$g(z^{2}) = G(z^{2}, ..., z^{n}, z^{1}),$$

$$\vdots$$

$$g(z^{n}) = G(z^{n}, z^{1}, ..., z^{n-1}).$$
(65)

Therefore, $(z^1, z^2, ..., z^n)$ is a *n*-tuplet coincidence point. Then from the assumption with $x^{1*} = z^1, ..., x^{n*} = z^n$ it follows $g(z^1) = g(x^1), g(z^2) = g(x^2), ..., g(z^n) = g(x^n)$; that is,

$$g(z^{1}) = z^{1},$$

$$g(z^{2}) = z^{2},$$

$$\vdots$$

$$g(z^{n}) = z^{n}.$$
(66)

By (65) and (66),

$$z^{1} = g(z^{1}) = G(z^{1}, z^{2}, ..., z^{n}),$$

$$z^{2} = g(z^{2}) = G(z^{2}, ..., z^{n}, z^{1}),$$

$$\vdots$$

$$z^{n} = g(z^{n}) = G(z^{n}, z^{1}, ..., z^{n-1}).$$
(67)

Hence, $(z^1, z^2, ..., z^n)$ is a *n*-tuplet common fixed point of *G* and *g*. To prove the uniqueness, assume that $(q^1, q^2, ..., q^n)$

is another n-tuplet common fixed point. Then by assumption we have

$$q^{1} = g(q^{1}) = g(z^{1}),$$

$$q^{2} = g(q^{2}) = g(z^{2}),$$

$$\vdots$$

$$q^{n} = g(q^{n}) = g(z^{n}).$$

$$\Box$$
